VIDEO ANALYSIS

Twilio Regions

Twilio Regions are isolated data centres around the world where Twilio performs the processing and storage required to enable your application's communications activities.

Twilio's default Region is located in the eastern United States (US). If you are operating your application or serving a customer base in a different part of the world, you might be aware that relying on Twilio's US-based infrastructure can result in serious business challenges such as:

Severe latency due to the geographical distance between your application and Twilio

Unmet data residency requirements

This guide introduces the key concepts you need to understand to overcome these challenges by integrating your application with a non-US Twilio Region.

By reading this guide, you'll learn:

What kinds of processing and storage are carried out in Twilio Regions

How Twilio's Region isolation model works, and how it impacts your application design

How to select an optimal Twilio Region for your application

some of the twilio regions are:
Twilio API Keys, Phone numbers, Call logs, Messaging services,TwiML applications,Studio flows, Serverless functions, Flex configurations, Video rooms, Email templates and Access control list.
